8. Troubleshooting and FAQ

1. What is Editor Pets?

Editor Pets adds small pixel-art companions to the Unity **Scene View**. They wander along the bottom of the view, take naps, eat, chase a ball and react when you click them, while you keep working on your game.

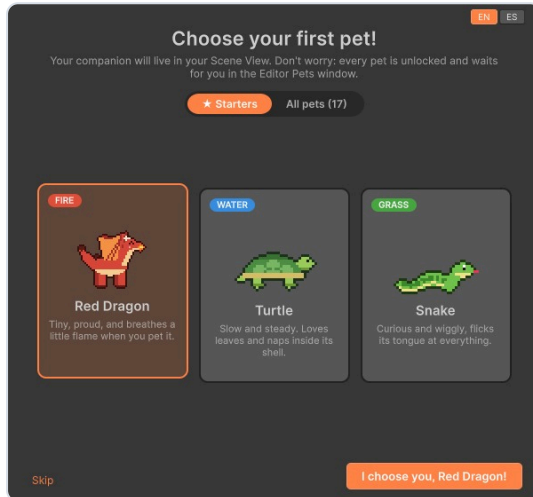

Pets walking along the bottom of the Scene View while a level is being edited.

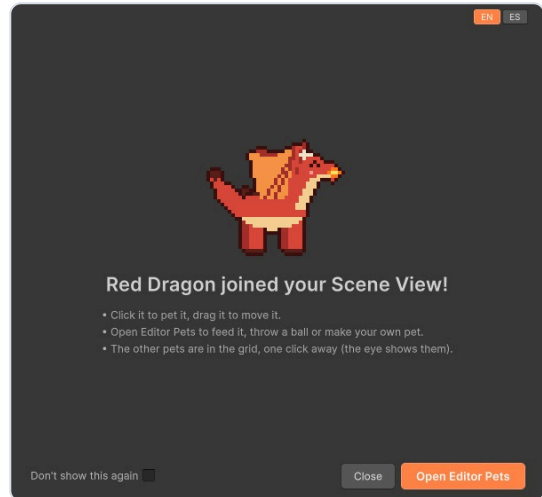

- **Editor-only:** everything lives in an editor assembly. Nothing is added to your builds and nothing runs in Play Mode builds.
- **Lightweight:** pets are drawn as an overlay (no GameObjects, no scene changes) and repaints are limited to 30 fps.
- **17 pets included**, each with Idle, Walk, Sleep, Eat and Happy animations, plus a library of 16 foods.
- **Make your own** from a sprite sheet in two clicks.
- Works with any render pipeline, light and dark editor themes, and several Scene Views at once.

2. Installation and first launch

1. Import the package. It installs into `Assets/KrostGames/EditorPets`. You can move the folder anywhere later (even into `Packages/`); the tool finds its files on its own.
2. The **Welcome** window opens and asks you to **choose your first pet**: a Fire, Water or Grass starter, or any of the 17 pets from the *All pets* tab. Nothing is locked; the choice just decides who keeps you company first.
3. Click **I choose you!** The pet appears in your Scene View and the other pets are hidden (turn them back on any time).

Starter pick on first launch.

Your first pet joins the Scene View.

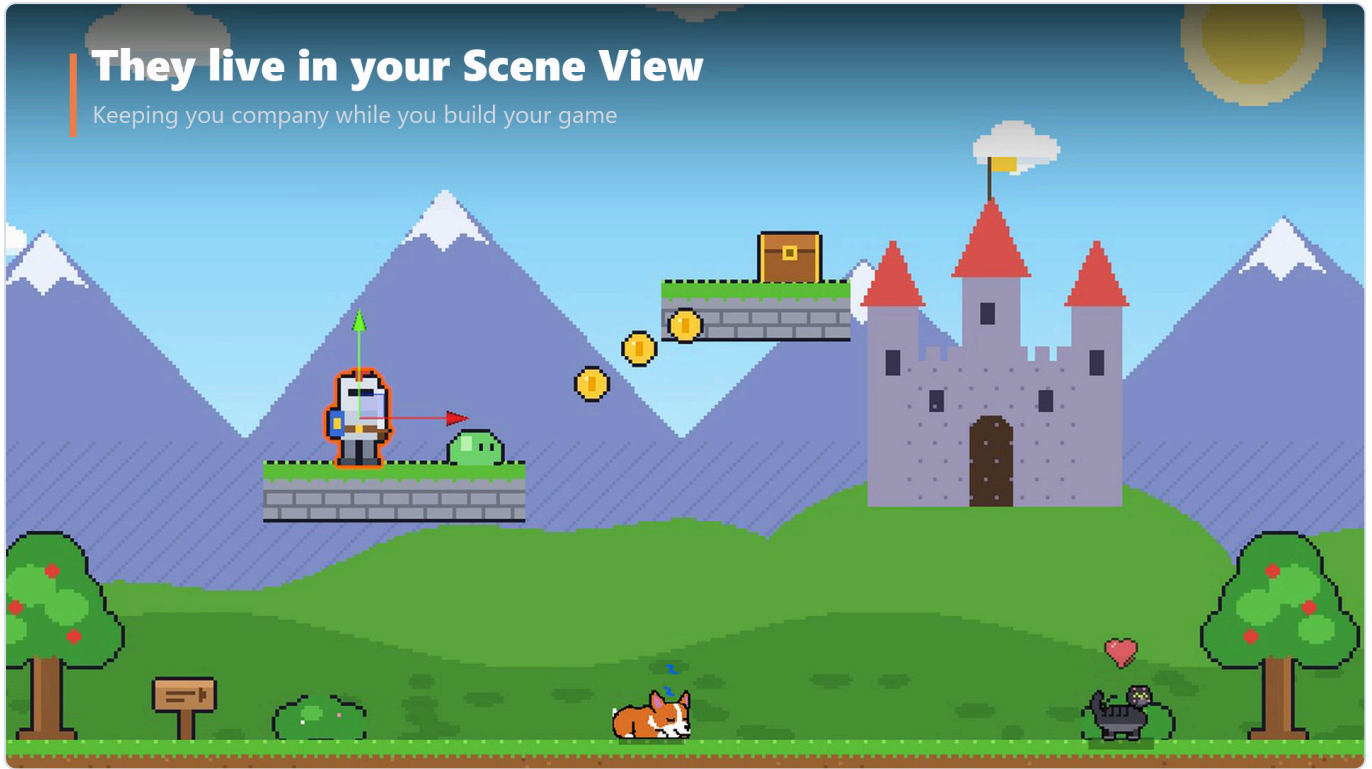

You can reopen this window from **Tools** → **Editor Pets** → **Welcome**.

Demo scene

Tools → **Editor Pets** → **Open Demo Scene** (or *Open demo scene* in the Welcome window) opens `Demo/EditorPets_Demo.unity`, a small pixel-art platformer level, and frames it in a 2D Scene View so you can watch your pets walk on the grass.

They live in your Scene View

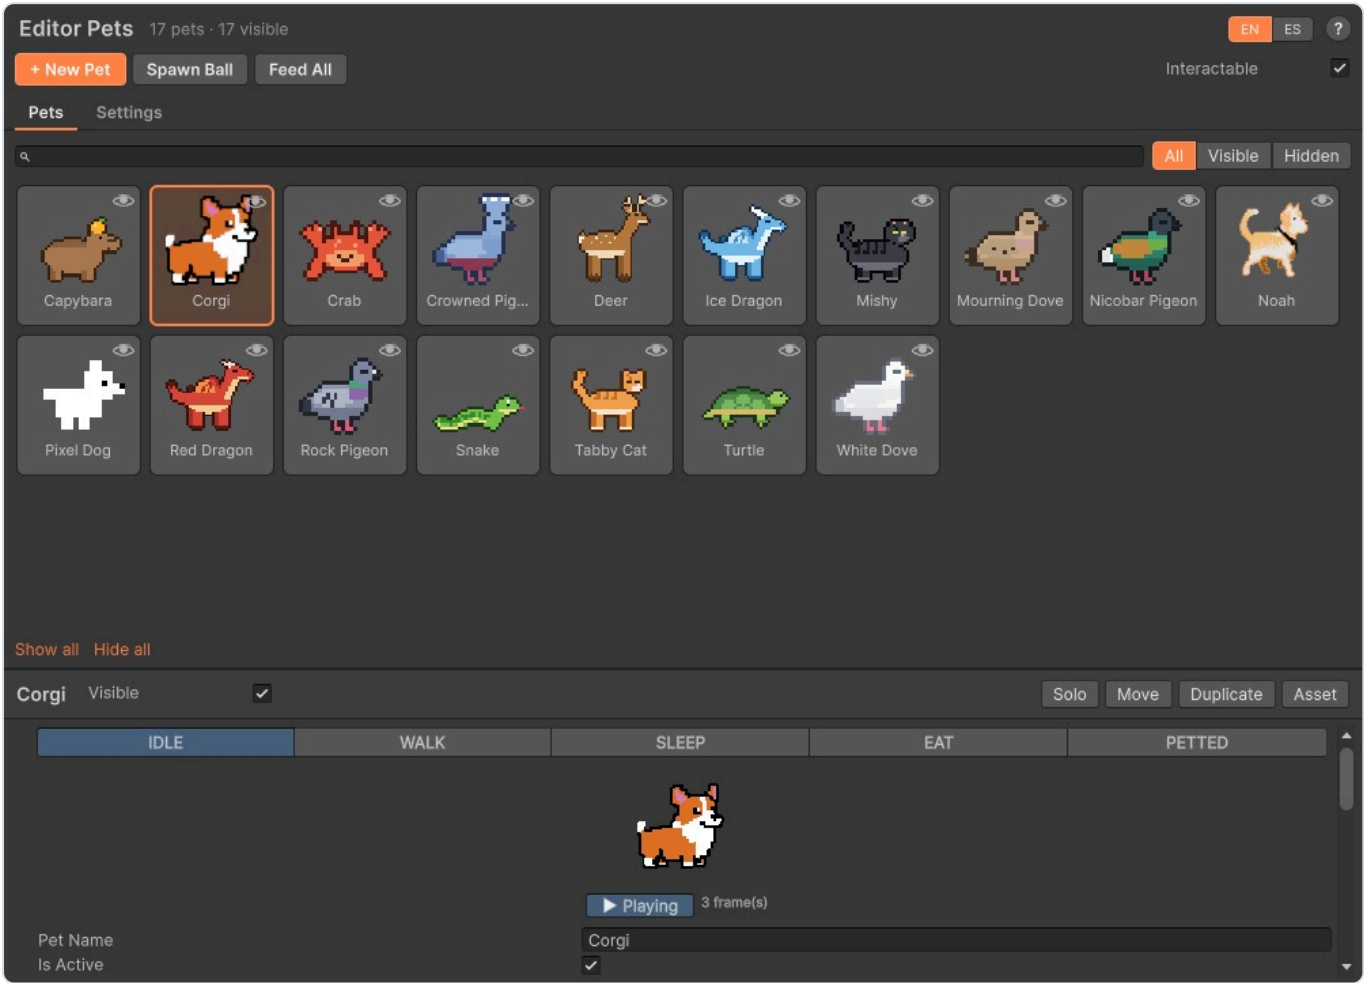

Keeping you company while you build your game

The demo scene with pets.

3. The Editor Pets window

Open it from **Tools** → **Editor Pets** → **Settings**. It has a header, a toolbar and two tabs.

Pets tab: grid of pets on top, the selected pet below.

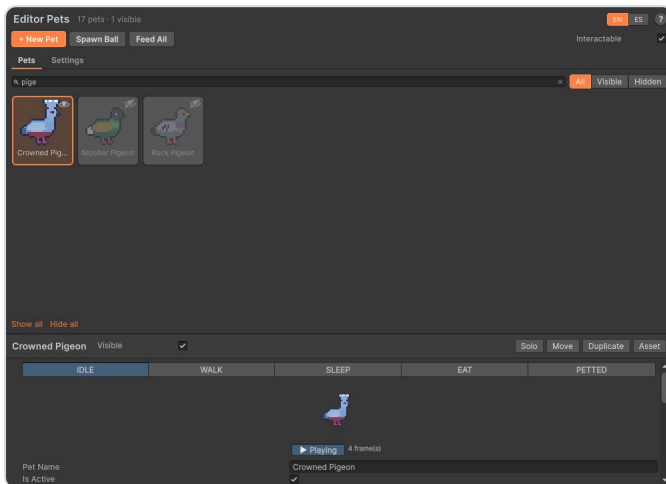

Header and toolbar

Control	What it does
Counter	How many pets exist and how many are visible.
EN / ES	Switches the window language (English / Spanish).
?	Quick help on making your own pet.
+ New Pet	Creates a pet from the sprite sheets selected in the Project window (see chapter 5).
Spawn Ball	Drops a ball in the Scene View. Drag it to throw it; pets chase it.
Feed All	Every visible pet eats its own food for a few seconds.
Interactable	Turn off if pets get in the way of your clicks in the Scene View.

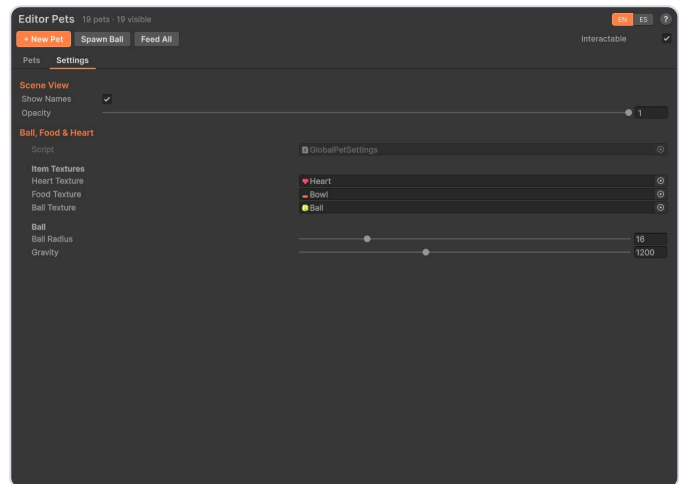

Pets tab

- **Grid:** animated thumbnails (they walk when you hover them). Hidden pets are dimmed.

- **Search** by name and filter **All / Visible / Hidden**.
- **Eye** on each tile: show or hide that pet. **Show all / Hide all** under the grid. Everything can be undone with Ctrl+Z.
- **Click** a tile to select it, **double-click** to select the asset in the Project window, **right-click** for more: show/hide, *show only this one*, move to a random spot, duplicate, select asset.
- **Details pane** (drag the divider to resize): Visible, **Solo** (hide every other pet), Move, Duplicate, Asset, and the full pet inspector.

Searching "pige" and using Solo on the Crowned Pigeon.

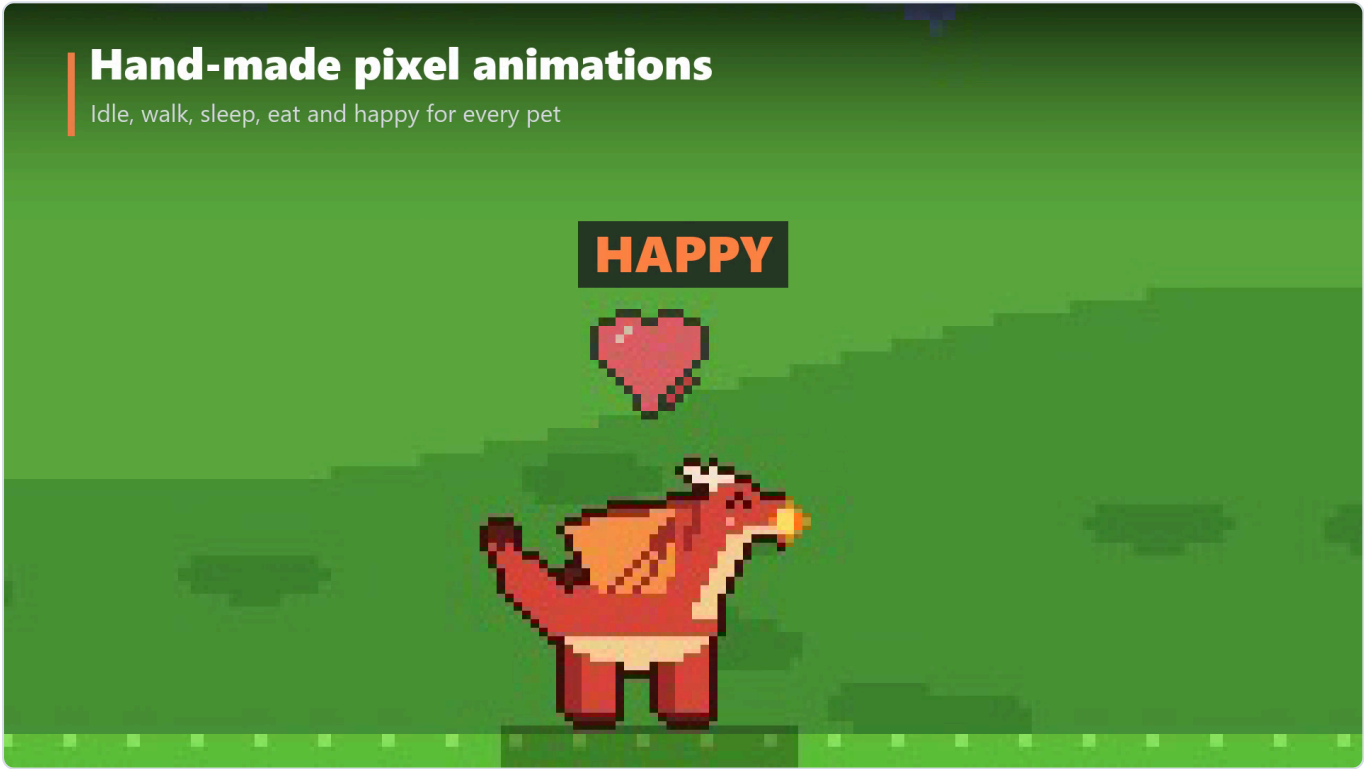

Settings tab.

Settings tab

- **Show Names** and **Opacity** of the pets in the Scene View (saved per user).
- **Ball, Food & Heart:** the shared textures (heart, default food, ball), ball radius and gravity. Stored in `Items/GlobalPetSettings.asset`, which is recreated automatically if you delete it.

4. Playing with the pets in the Scene View

Action	Result
Click a pet	Pets it: a heart pops up and the Happy animation plays.
Drag a pet	Moves it. Release it and it lands on the floor of the view.
Drag a pet out of the Scene View and drop it on the Editor Pets window	Hides it.
Drag a pet asset from the Project window into the Scene View	Shows it.
Spawn Ball, then drag and release the ball	Throws it; pets chase it.
Feed All	Each pet eats its own food.

Every pet has Idle, Walk, Sleep, Eat and Happy animations.

On their own, pets idle, walk, and sometimes fall asleep for 10–20 seconds. Eating lasts 4 seconds, being petted 2 seconds.

5. Creating your own pet (step by step)

A pet is one **PetData** asset plus one to five sprite sheets. This chapter walks you through the whole process.

5.1 Draw the sprite sheets

1

2

3

4

Mishy_Walk.png = 128 x 32 px = 4 square frames of 32 x 32

A sprite sheet is a single row of square frames.

- **One row** of frames, side by side, no gaps, transparent background, PNG.
- **Square frames** (width = height). The number of frames is then detected automatically as *width ÷ height*. Example: 4 frames of 32×32 → a 128×32 PNG.
- Use the **same frame size** for all the sheets of a pet, draw it **facing right** (it is flipped automatically when walking left) and put its **feet on the bottom row** of the frame.
- Good sizes are 16, 24, 32, 40 or 64 px per frame, with 2–8 frames per animation.
- Tools: Aseprite (*File → Export Sprite Sheet → By Rows, 1 row*), Piskel, LibreSprite or Photoshop all work.

5.2 Which animations

State	When it plays	Word in the file name	If missing
Idle (required)	Standing still, and while being dragged	idle or anything else	—
Walk	Walking and chasing the ball	walk or run	uses Idle
Sleep	Napping	sleep	uses Idle
Eat	After Feed All	eat	uses Idle
Petted	After a click	happy or petted	uses Idle

The five sheets of Mischy, named so they are assigned automatically.

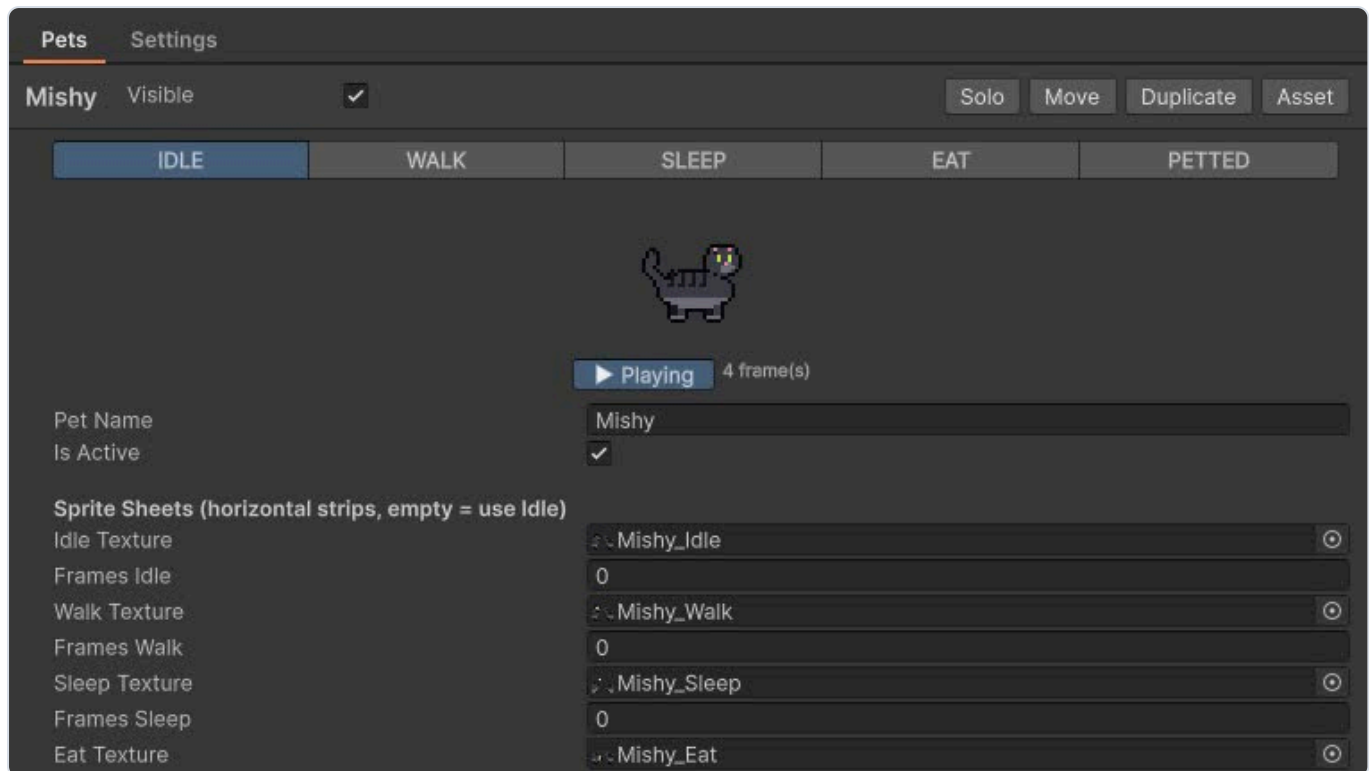

5.3 Put them in a folder

Create a folder such as `Assets/KrostGames/EditorPets/Pets/My Cat/` (any folder in your project works) and copy the PNGs there. Keeping each pet in its own folder, like the bundled ones, keeps its asset and sprites together.

5.4 Create the pet

1. Select all the PNGs of the pet in the Project window.
2. Click + **New Pet** in the Editor Pets window, or right-click → **Create** → **EditorPets** → **New Pet**.
3. The pet asset is created **next to the sprites**, named after the first word of the file name (*Mishy_Walk.png* → *Mishy*), is selected, and starts walking in the Scene View.

If the PNGs are still on Unity's default texture import settings, New Pet switches them to **Sprite, Point filter, no compression** so the pixels stay crisp and the frame count is correct. Textures you already configured are left untouched.

The pet inspector (also shown in the details pane of the window).

5.5 Fine-tune it in the inspector

- **Preview** with tabs IDLE / WALK / SLEEP / EAT / PETTED, play/pause and the resolved number of frames. Use it to check each sheet.
- **Pet Name**: shown above the pet when *Show Names* is on. **Is Active**: visible in the Scene View.
- **Sprite Sheets** and **Frames**: drop another texture into any state; leave Frames at **0** for automatic, or type the number of frames only if your frames are not square.
- **Food**: click one of the foods of the library (the chosen one is highlighted in orange), or drop any texture in the field.
- **Animation Speed** (frames per second, shared by all states), **Move Speed** (pixels per second) and **Size** (pixels in the Scene View). For crisp pixel art use a whole multiple of the frame size: 32 px frames → 64 or 96.

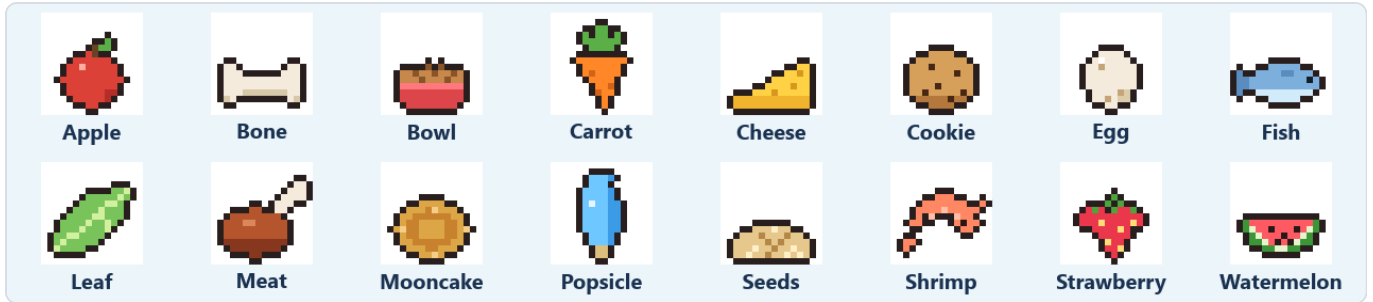

5.6 Variants and manual creation

- **Duplicate** (details pane or right-click) copies a pet so you can swap its sheets or change its name, speed, size or food.
- You can also create an empty pet with **Create** → **EditorPets** → **New Pet** without selecting textures, then fill in the fields by hand.

5.7 Checklist

Problem	Fix
The animation jumps or shows half frames	The frames are not square: type the real number of frames in <i>Frames</i> .
The pet looks blurry	Set the texture's Filter Mode to Point and Compression to None .
A white square appears	The pet has no Idle texture.
The pet is tiny or huge	Change Size (e.g. 2× the frame size).
It walks backwards	Draw the sprites facing right.

6. Food

The food library in Items/Food.

- Each pet eats its own **Food** (set in its inspector). Pets without food eat from the default **Bowl** (Settings tab).
- To add a food, drop a small PNG (16×16 works great; Point filter) into `Items/Food/`. It appears in the food picker of every pet.
- Food is drawn in front of the pet's mouth, on the floor, while it plays its Eat animation.

7. For programmers

All code is in the `EditorPets` namespace, in the editor-only assembly `EditorPets.Editor`.

Member	Description
<code>PetData</code>	ScriptableObject: <code>petName</code> , <code>isActive</code> , five textures with their frame counts (0 = auto), <code>food</code> , <code>animationSpeed</code> , <code>moveSpeed</code> , <code>size</code> . <code>GetAnimation(PetState)</code> returns the texture and frame count used for a state (with the Idle fallback).
<code>ScenePetOverlay.SetVisible(pet, bool)</code>	Shows or hides a pet (undoable).
<code>ScenePetOverlay.SetAllVisible(bool) / ShowOnly(pet)</code>	Show or hide every pet / keep only one visible.
<code>ScenePetOverlay.FeedAll() / SpawnBall()</code>	Same as the toolbar buttons.
<code>ScenePetOverlay.CreatePetFromSelection()</code>	The + New Pet command.
<code>ScenePetOverlay.Duplicate(pet) / RandomizePetPosition(pet)</code>	Copy a pet asset / move it to a random spot.

The Scene View always reflects each pet's `isActive` (changes from scripts, the inspector or Undo are picked up automatically). User preferences are stored in EditorPrefs: `EditorPets_Interactable`, `EditorPets_ShowNames`, `EditorPets_Opacity`, `EditorPets_IsEnglish`, `EditorPets_Welcomed_v1`.

8. Troubleshooting and FAQ

Question	Answer
I don't see any pet.	Open the Editor Pets window: check the counter and click Show all . Pets live along the bottom of the Scene View.
Pets block my clicks on scene objects.	Turn off Interactable in the toolbar.
Are pets included in my build?	No. Everything is editor-only.
Does it cost performance?	Very little: pets are an overlay and repaints are capped at 30 fps. Hide pets you don't need.
Several Scene Views?	Supported: pets appear in all of them, standing on each view's floor.
How do I uninstall it?	Delete the <code>EditorPets</code> folder. Optionally remove the EditorPrefs keys listed in chapter 7.

Support: use the contact link on the KrostGames publisher page of the Unity Asset Store.
